1) Explain the significance of the dark web as a source of threat intelligence. What types of information can be found on the dark web, and how can organizations leverage this data to enhance their cybersecurity strategies?

   Answer: If you can monitor activity on the dark web, you can gather intelligence about how threat actors are using the dark web. It can also give you intel on what programs are being used and where these actors are coming from, and not in a geographical sense.

2) What challenges do cybersecurity professionals face when it comes to validating the credibility and accuracy of threat intelligence from different sources? How can organizations overcome these challenges to make informed decisions?

   Answer: There are many challenges when it comes to validation of sources. Organizations can overcome these obstacles by utilizing trust resources such as NIST and other accredited organizations.
